Intake Spec v1.2: Design and Dev Responsibilities

Proposal from the Design team to the Delivery Lead
Your Oracle Clinician, 27 October 2026

Summary

Design owns how the intake looks and feels: wording, placement, screens and demo paths. The AI/Dev team owns the logic: which question is shown when, warning rules, and what the AI is told. Design work is 2 days.

1. Why we're proposing this

#	Reason
1	The prototype is a design tool. It has no real backend and no real AI.
2	Most of the v1.2 spec is conditional logic: which question appears for which body, age, stage or gender. The real engine has to do this anyway.
3	Building the same logic in the prototype would create two versions of the rules, which would drift apart.
4	Design decides how a question appears. The engine decides whether it appears.

2. Design team tasks (2 days)

Group	Task	Time
Wording and options	Update gender, sex at birth and pronoun choices to v1.2	0.25 day
	Add "Prefer not to say" where the spec requires it	
	Simpler wording for the teen intersex question	
	Full list of 7 HRT types	
	Decide where each question sits: sign-up, onboarding, Health Profile or chat	
New screen patterns	"Who are you asking about today?" picker	1 day
	Chat banners for child, older parent and general information chats	
	Yes / No / N/A symptom row	
	"Me / family" medical history grid	
	Multi-select organ picker	
	Include / exclude toggles on the provider summary	
Demo paths	Trans man profile	0.5 day
	Parent asking about a child	
	Asking about a partner (general information only)	
	Older parent with an urgent warning	
Handoff notes	One line per question: "shows when X; if Y, then Z", with a link to the spec	0.25 day

The routing code added for the demo is a stand-in only and should not be used as the real rules.

3. AI / Dev team responsibilities

Area	What it means
Question branching rules	Which question shows for which organs, sex at birth, stage, age and gender. Never route by gender alone. "Prefer not to say" never blocks.

Chat type flag (A/B/C/D)	Self, child, older parent, partner. Set at the start of each chat and passed to the AI as fixed context. Never guessed or changed mid-chat.
Warning levels by chat type	The same symptoms give different urgency depending on who the chat is about, including the older-parent UTI / sepsis rule.
Answer logic	N/A pre-set on the symptom list, required vs. optional fields, no repeated questions between the profile and the chat.
What the AI is told	Which profile answers go to the AI, pronouns and body terms in replies, and the content of the provider summary.
Data and privacy	Encryption, no sensitive fields sent to analytics or Shopify, edit and delete for each answer, data handling for under-13s and proxies.
Platform	Stripe payments, social login, and syncing new articles into the knowledge base.

4. Shared items

Item	**Design**	**AI / Dev**
"Who are you asking about?"	Screen, wording, banners	Stores and passes the flag; selects the logic
Symptom checklist	Yes / No / N/A row	Which items apply; N/A rules
Provider summary	Layout and toggles	Content and PDF generation
Teen and child forms	Layout, tone, grouping	Fields, age rules, legal limits

5. Effort

Team	**Scope**	**Time**
Design	Wording, placement, screen patterns, demo paths, handoff notes	2 days
AI / Dev	Branching rules, chat type flag, warning levels, AI context, privacy, platform	To be estimated by the AI/Dev team
